Project Name	BookEase – Multi-Role Online Bookstore Platform
Maximum Marks	2 Marks

The Problem-Solution Fit canvas confirms that the problem identified with BookEase’s customers is real, and that the proposed solution genuinely addresses it.

Canvas Element	BookEase
Purpose	Give readers, independent sellers and platform operators one trustworthy place to buy, sell, and manage books online.
Customer Segment(s)	Individual book buyers (students & working professionals); independent booksellers / small publishers; the platform operator/admin team.
Problem / Root Cause	Fragmented book buying across multiple stores/sites; sellers lack affordable online reach; no centralized quality/trust control across sellers, listings and orders.
Triggers	Needing a specific book urgently; a seller losing walk-in footfall and wanting online sales; an admin needing visibility after a bad seller experience or user complaint.
Emotional Response (existing)	Frustration from comparing prices across sites; anxiety about paying a seller with no reputation history; admin stress from lack of oversight tools.
Channels of Behaviour (existing)	Physical bookstores, generic e-commerce marketplaces, informal seller listings on social media, word-of-mouth.
Existing Alternatives	General marketplaces (with high seller fees and little book-specific curation), single-seller bookstore websites, offline stores with limited stock.
TG Value Proposition	A book-focused marketplace with role-based flows: fast discovery and transparent checkout for buyers, low-friction listing tools for sellers, and full administrative control for platform trust.
Adoption Strategy	Free seller onboarding with a simple approval step; wishlist/coupons to drive first purchase; ratings and order transparency to build repeat trust.
Customer Constraints	Sellers need admin approval before listing (quality gate); customers need an account to check out; delivery charges apply below a minimum order value.
